## Speed equation of same space ships and their meeting at one point in space OXYZ

If the above mentioned space ship is denoted by $\left(\mathrm{S}_{1}\right)$ in the system, parameters of speed and distance shall also be denoted in the system that is $\left(\mathrm{S}_{2}\right)$ :
$\left(V_{x 1}, V_{y 1}, V_{z 1}, x_{1}, y_{1}, z_{1}\right)$
Problem: space ship $\left(\mathrm{S}_{2}\right)$ is moving to support and assist space ship $\left(\mathrm{S}_{1}\right)$.
$\left(\mathrm{V}_{\mathrm{x} 2} . \mathrm{V}_{\mathrm{y} 2} . \mathrm{V}_{\mathrm{z} 2} \cdot \mathrm{x}_{2} . \mathrm{y}_{2} . \mathrm{z}_{2}\right)$
Compare the speed equations of the 2 space ship with each other so that space ship $\left(S_{1}\right)$ meets space ship $\left(\mathrm{S}_{2}\right)$ at a specified time.
Solution: $V_{T S 2}$ will suffice to be larger than $V_{T S 1}$. That is $V_{T S 2}>V_{T S 1}$.
Problem:
In the above problem, space ships $\left(\mathrm{S}_{1}\right)$ and $\left(\mathrm{S}_{2}\right)$ were compared. Here, some space ships are compared so that some space ships $\left(\mathrm{S}_{2}\right),\left(\mathrm{S}_{3}\right),\left(\mathrm{S}_{4}\right), \ldots\left(\mathrm{S}_{\mathrm{n}}\right)$ will simultaneously meet space ship ( $\mathrm{S}_{1}$ ) will move first, followed by $\left(\mathrm{S}_{2}\right),\left(\mathrm{S}_{3}\right), \ldots\left(\mathrm{S}_{\mathrm{n}}\right)$, respectively.

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{TS} 1}<\mathrm{V}_{\mathrm{TS} 2}<\mathrm{V}_{\mathrm{TS} 3}<\mathrm{V}_{\mathrm{TS} 4} \ldots .<\mathrm{V}_{\mathrm{TSn}} \\
& \mathrm{~V}_{\mathrm{x} 1}<\mathrm{V}_{\mathrm{x} 2}<\mathrm{V}_{\mathrm{x} 3}<\mathrm{V}_{\mathrm{x} 4} \ldots .<\mathrm{V}_{\mathrm{xn}} \\
& \mathrm{~V}_{\mathrm{y} 1}<\mathrm{V}_{\mathrm{y} 2}<\mathrm{V}_{\mathrm{y} 3}<\mathrm{V}_{\mathrm{y} 4} \ldots . .<\mathrm{V}_{\mathrm{yn}} \\
& \mathrm{~V}_{\mathrm{z} 1}<\mathrm{V}_{\mathrm{z} 2}<\mathrm{V}_{\mathrm{z} 3}<\mathrm{V}_{\mathrm{z} 4} \ldots .<\mathrm{V}_{\mathrm{zn}}
\end{aligned}
$$
